Title: V-PCC test model v5 user manual

Status: Draft

Purpose: User manualAuthor(s): Julien Ricard

julien.ricard@technicolor.com

Document: MPEG-w18176

Source: 3DG

## Abstract

This document is a user manual describing usage of reference software for the V-PCC project. It applies to version 5.0 of the software.

## **Contents**

		3.4.3 Metrics parameters	9

## **General Information**

Reference software is being made available to provide a reference implementation of the V-PCC standard being developed by MPEG (ISO/IEC SC29 WG11). One of the main goals of the reference software is to provide a basis upon which to conduct experiments in order to determine which coding tools provide desired coding performance. It is not meant to be a particularly efficient implementation of anything, and one may notice its apparent unsuitability for a particular use. It should not be construed to be a reflection of how complex a production-quality implementation of a future V-PCC standard would be.

This document aims to provide guidance on the usage of the reference software. It is widely suspected to be incomplete and suggestions for improvements are welcome. Such suggestions and general inquiries may be sent to the general MPEG 3DGC email reflector at mpeg-3dgc@gti.ssr.upm.es (registration required).

1

## **Bug reporting**

Bugs should be reported on the issue tracker set up at http://mpegx.int-evry.fr/software/MPEG/PCC/TM/mpeg-pcc-tmc2/issues.

## **Obtaining the software**

#### Clone

The authoritative location of the software is the following git repository: <a href="http://mpegx.int-evry.fr/software/MPEG/PCC/TM/mpeg-pcc-tmc2">http://mpegx.int-evry.fr/software/MPEG/PCC/TM/mpeg-pcc-tmc2</a>

Each released version may be identified by a version control system tag in the form release-v5.0.

An example:

```
$ git clone http://mpegx.int-evry.fr/software/MPEG/PCC/mpeg-pcc-tmc2.git
$ cd mpeg-pcc-tmc2
```

It is strongly advised to obtain the software using the version control system rather than to download a zip (or other archive) of a particular release. The build system uses the version control system to accurately identify the version being built.

## **Building**

The codec is supported on Linux, OSX and Windows platforms. The build configuration is managed using CMake.

It is strongly advised to build the software in a separate build directory.

## **Scripts**

Bash scripts can be use to build mpeg-pcc-dmetric project: build.sh to build solutions and clear.sh to clean.

#### Linux

```
mkdir build
cd build
cmake ..
make
../bin/PccAppEncoder --help
../bin/PccAppDecoder --help
../bin/PccAppMetrics --help
```

## **OSX**

```
mkdir build
cd build
cmake .. -G Xcode
xcodebuild
../bin/PccAppEncoder --help
../bin/PccAppDecoder --help
../bin/PccAppMetrics --help
```

As an alternative, the generated XCode project may be opened and built from XCode itself.

2

#### Windows

```
md build
cd build
cmake .. -G "Visual Studio 15 2017 Win64"
```

Open the generated visual studio solution to build it.

## Using the codec

```
../bin/PccAppEncoder [--help] [-c config.cfg] [--parameter=value] ../bin/PccAppDecoder [--help] [--parameter=value] ../bin/PccAppMetrics [--help] [--parameter=value]
```

## **Principle**

The encoder takes as input a PLY file describing a point cloud with integer positions and, optionally, per-point integer colour attributes.

The output of the encoder is a binary bitstream encapsulated using the V-PCC annex-B format.

Conversely, the decoder takes as input a compressed bitstream file in V-PCC annex-B format and produces a reconstructed PLY file with position and any present attribute values.

The software may be configured using either command line arguments or from a configuration file specified using the -c|--config= option.

Sample configuration files are provided in the cfg/ directory.

Parameters are set by the last value encountered on the command line. Therefore if a setting is set via a configuration file, and then a subsequent command line parameter changes that same setting, the command line parameter value will be used.

## **Common test condition configurations**

The configuration files stored in the ./cfg/ sub-folder could be used to perform the V-PCC common test conditions (CTC) experiments. An example of the usage of this file could be found in ./test/runme\_linux.sh.

The reference software configuration not defined the CTC, please validated your experimentes based on the wxxxxxx- V-PCC common test conditions document.

#### **Examples**

## **Encoder**

The next command line encodes one streams:

```
./bin/PccAppEncoder \
    --config=./cfg/common/ctc-common.cfg \
    --config=./cfg/condition/ctc-all-intra.cfg \
    --config=./cfg/sequence/queen.cfg \
    --config=./cfg/rate/ctc-r1.cfg \
    --colorTransform=0 \
    --configurationFolder=./cfg/ \
    --uncompressedDataFolder=./People/ \
    --colorSpaceConversionPath=./external/HDRTools/bin/HDRConvert \
    --videoEncoderPath=./external/HM-16.18+SCM-8.7/bin/TAppEncoderHighBitDepthStatic \
    --videoEncoderOccupancyMapPath=./external/HM-16.18+SCM-8.7/bin/TAppEncoderHighBitDepthStat --compressedStreamPath=./S22C2AI_queen/S22C2AIRO1_queen.bin \
    --frameCount=32
```

To compute the metrics in the encode, the normal of the source point cloud must be given to the encoder. The next parameter must be added to the previous command:

3

```
--normalDataPath=./People/Technicolor/queen_n/frame_%04d_n.ply
```

#### Decoder

The next command line decodes one streams:

To compute the metrics in the decoder, the normal of the source point cloud and the source PLY must be given to the decoder. The next parameter must be added to the previous command:

```
--config=./cfg/sequence/queen.cfg \
--uncompressedDataFolder=./People/ \
--normalDataPath=./People/Technicolor/queen_n/frame_%04d_n.ply
```

#### **Metrics**

PccAppMetrics could be used to test the PccLibMetrics. For CTC experiments, it's sugested to used mpeg-pcc-dmetrics: http://mpegx.int-evry.fr/software/MPEG/PCC/mpeg-pcc-dmetric.git.

For example, mpeg-pcc-dmetric and PccAppMetric could be used with the next command line:

```
../bin/PccAppMetrics \
--uncompressedDataPath=./People/8i/8iVFBv2/longdress/Ply/longdress_vox10_1051.ply \
--reconstructedDataPath=./S26C2AIR01_longdress_dec_1051.ply \
--normalDataPath=./People/8i/longdress_n/longdress_vox10_1051_n.ply \
--resolution=1023 \
--frameCount=1

./mpeg-pcc-demetric/test/pc_error \
--fileA=./People/8i/8iVFBv2/longdress/Ply/longdress_vox10_1051.ply \
--fileB=S26C2AIR01_longdress_dec_1051.ply \
--inputNorm=./People/8i/longdress_n/longdress_vox10_1051_n.ply \
--color=1 \
--resolution= 1023
```

The two softwares give the same results.

#### **General options**

The next tables shows the parameters of the encoder, decoder and metrics programs.

## **Encoder parameters**

Parameter=Value	Usage
-help=0	This help text
Global	
-c,-config=	Configuration file name
-configurationFolder=""	Folder where the configuration files
	are stored, use for cfg relative

	paths.
-uncompressedDataFolder=""	Folder where the uncompress input data
uncompressed buttur order	are stored, use for cfg relative
	paths.
-uncompressedDataPath=""	Input pointcloud to encode.
-uncompressed Datar attr-	Multi-frame sequences may be
	represented by %04i
-compressedStreamPath=""	Output
-compressed stream atti-	compressed bitstream
-reconstructedDataPath=""	Output decoded pointcloud. Multi-frame
-reconstructedDataFatti-	sequences may be represented by %04i
-startFrameNumber=0	
-startFrameNumber-0	First frame number in sequence to encode/decode
-frameCount=300	Number of frames to encode
-groupOfFramesSize=32	Random access period
-colorTransform=1	The colour transform to be applied:
	0: none
	1: RGB to YCbCr (Rec.709)
-colorSpaceConversionPath=""	Path to the HDRConvert. If unset, an
	internal color space conversion is
	used
-colorSpaceConversionConfig=""	HDRConvert configuration file used for
	RGB444 to YUV420 conversion
-inverseColorSpaceConversionConfig=""	HDRConvert configuration file used for
	YUV420 to RGB444 conversion
-videoEncoderPath=""	HM video encoder executable
-videoEncoderOccupancyMapPath=""	HM lossless video encoder executable
	for occupancy map
-nbThread=1	Number of thread used for parallel
	processing
-keepIntermediateFiles=0	Keep intermediate files: RGB, YUV and
	bin
Encoder	
-nnNormalEstimation=16	Number of points used for normal
	estimation
-maxNNCountRefineSegmentation=256	Number of nearest neighbors used
	during segmentation refinement
-iterationCountRefineSegmentation=100	Number of iterations performed during
	segmentation refinement
-occupancyResolution=16	Resolution T of the occupancy map
-minPointCountPerCCPatchSegmentation=16	Minimum number of points for a
-	connected component to be retained as
	a patch
-maxNNCountPatchSegmentation=16	Number of nearest neighbors used
-	during connected components
	extraction
-surfaceThickness=4	Surface thickness
-maxAllowedDepth=255	Maximum depth per patch
-maxAllowedDist2MissedPointsDetection=9	Maximum distance for a point to be
and the second s	ignored during missed point detection
-maxAllowedDist2MissedPointsSelection=1	Maximum distance for a point to be
	ignored during missed points
	-5 daring impood points

5

	selection
-lambdaRefineSegmentation=3	Controls the smoothness of the patch
idinodare interesegnentation 3	boundaries during segmentation
	refinement
-minimumImageWidth=1280	Minimum width of packed patch frame
-minimumImageHeight=1280	Minimum height of packed patch frame
-maxCandidateCount=4	Maximum nuber of candidates in list L
-occupancyPrecision=4	Occupancy map B0 precision
-occupancyMapVideoEncoderConfig=""	Occupancy map encoder config file
-occupancyMapQP=8	QP for compression of occupancy map
occupancy wap Q1 0	video
-useOccupancyMapVideo=1	compress occupancy map with video
use occupancy map video	codec

-reconstructedDataPath=""	Output decoded pointcloud. Multi-frame
	sequences may be represented by %04i
-startFrameNumber=0	Fist frame number in sequence to

7

	encode/decode
-colorTransform=1	The colour transform to be applied:
	0: none
	1: RGB to YCbCr (Rec.709)
-colorSpaceConversionPath=""	Path to the HDRConvert. If unset, an
	internal color space conversion is
	used
-inverseColorSpaceConversionConfig=""	HDRConvert configuration file used for
	YUV420 to RGB444 conversion
-videoDecoderPath=""	HM video decoder executable
-videoDecoderOccupancyMapPath=""	HM lossless video decoder executable
	for occupancy map
-nbThread=1	Number of thread used for parallel
	processing
-keepIntermediateFiles=0	Keep intermediate files: RGB, YUV and
	bin
Metrics	
-testLevelOfDetailSignaling=0	Disable patch sampling resolution
	scaling; use in conjunction with same
	parameter in encoder
-patchColorSubsampling=0	Enable per-patch color up-sampling
Metrics	
-computeChecksum=1	Compute checksum
-computeMetrics=1	Compute metrics
-uncompressedDataFolder=""	Folder where the uncompress input data
	are stored, use for cfg relative
	paths.
-startFrameNumber=0	Fist frame number in sequence to
	encode/decode
-frameCount=0	Number of frames to encode
-groupOfFramesSize=32	Random access period
-uncompressedDataPath=""	Input pointcloud to encode.
	Multi-frame sequences may be
	represented by %04i
-reconstructedDataPath=""	Output decoded pointcloud. Multi-frame
	sequences may be represented by %04i
-normalDataPath=""	Input pointcloud to encode.
	Multi-frame sequences may be
1.022	represented by %04i
-resolution=1023	Specify the intrinsic resolution
-dropdups=2	0(detect), 1(drop), 2(average)
	subsequent points with same
· 11 D	coordinates
-neighborsProc=1	0(undefined), 1(average), 2(weighted
	average), 3(min), 4(max) neighbors
177 1.0	with same geometric distance  Number of thread used for parallel
-nbThread=0	Number of thread used for parallel
	•
minimum III i I o	processing
-minimumImageHeight=0	processing Ignore parameter
-minimumImageHeight=0 -flagColorPreSmoothing=0 -surfaceSeparation=0	processing

8

## **Metrics parameters**

Parameter=Value	Usage
-help=0	This help text
-computeChecksum=1	Compute checksum
-computeMetrics=1	Compute metrics
-startFrameNumber=0	Fist frame number in sequence to
	encode/decode
-frameCount=0	Number of frames to encode
-uncompressedDataPath=""	Input pointcloud to encode. Multi-frame
	sequences may be represented by %04i
-reconstructedDataPath=""	Output decoded pointcloud. Multi-frame
	sequences may be represented by %04i
-normalDataPath=""	Input pointcloud to encode. Multi-frame
	sequences may be represented by %04i
-resolution=1023	Specify the intrinsic resolution
-dropdups=2	0(detect), 1(drop), 2(average) subsequent
	points with same coordinates
-neighborsProc=1	0(undefined), 1(average), 2(weighted
	average), 3(min), 4(max) neighbors with
	same geometric distance
-nbThread=0	Number of thread used for parallel
	processing
-minimumImageHeight=0	Ignore parameter
-flagColorPreSmoothing=0	Ignore parameter
-surfaceSeparation=0	Ignore parameter

9
